Analysis of Restaurants in Paris on the basis of its Type and Distance Using Foursquare API

A REPORT BY Raman Sharma

1) INTRODUCTION: - Paris, The Capital of France is considered as one of the best food cities in Europe. The French capital is bustling with great choices of new restaurants by talented young chefs from all over the world, plus an inventive and diverse array of casual dining options.

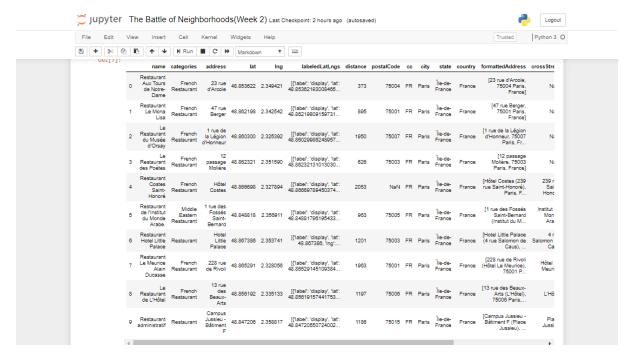

The idea of this project is to Analyse the various types of Restaurants present in Paris on the basis of its Type and Distance from the Centre by using the Foursquare API (Distance is in units since it is measured with the help of latitude and longitude coordinates.) which will be of great use to a client or a tourist to determine what are the types

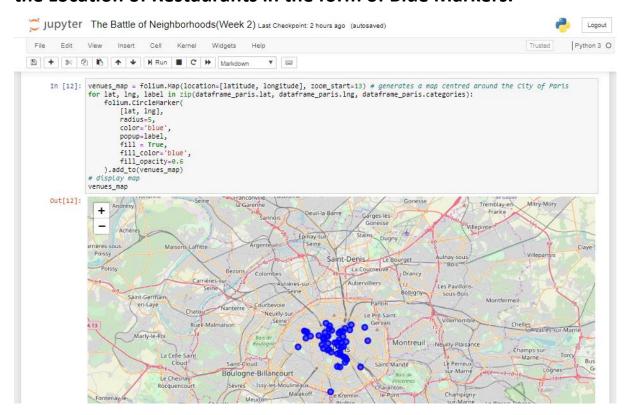

of Restaurants in Paris that are worth visiting based on its type and proximity.

I have taken Distance as a Parameter since it plays an important role for a tourist to decide which type of restaurant is near to his/her residence which will save time.

- <u>2) DATA</u>: The data that we will be using is the Foursquare Location Data of Paris, France which is of Restaurant Type by using the geographical coordinates in the form of Latitude and Longitude.
- 3) METHODOLOGY: 1) the first step is to import all the necessary Libraries like Pandas, Folium, Nominatim, Geocoders Seaborn etc.
- 2) Obtaining the Geographical Coordinates of Paris (Latitude and Longitude) by using Nominatim and Geocoders.
- 3) Setting up the Foursquare API by using the Client ID, Client Secret and other Credentials.
- 4) Specifying the Search Query that is, Restaurant.
- 5) Transforming the Information and filtering it as per the problem statement and converting it into a Pandas Dataframe.

6) Using the Folium Library to generate the Map of Paris showing the Location of Restaurants in the form of Blue Markers.

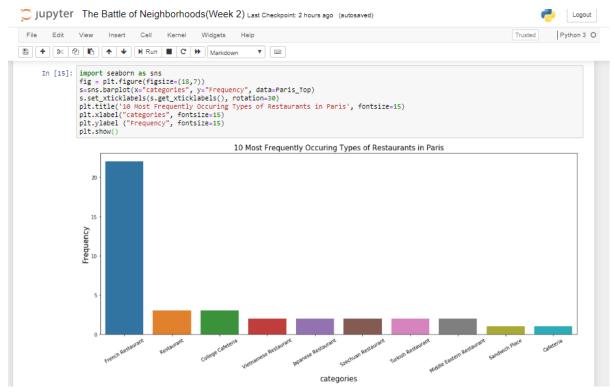

7) Performing Exploratory Data Analysis to Determine the Number of Each Type of Restaurants present in Paris and Visualizing the

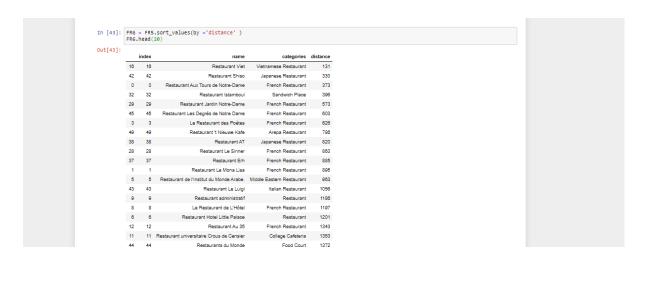

Information in the Form of a Bar Chart using the Seaborn Library.

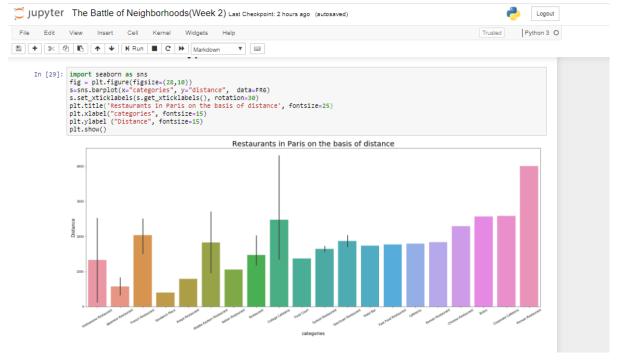

(This gives an idea of the type of Restaurants present in Paris)

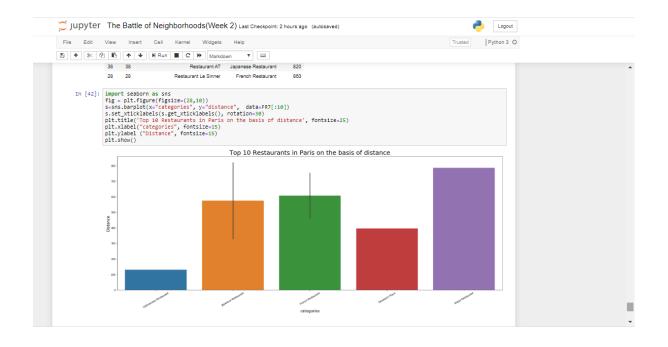

8) Taking Proximity as a Parameter and performing a similar exploratory data analysis as we did while determining the type of Restaurant, A New Dataframe is created by merging the smaller Dataframes which consist of name of the restaurant, its type and the Dataframe is sorted on the basis of distance from the centre.

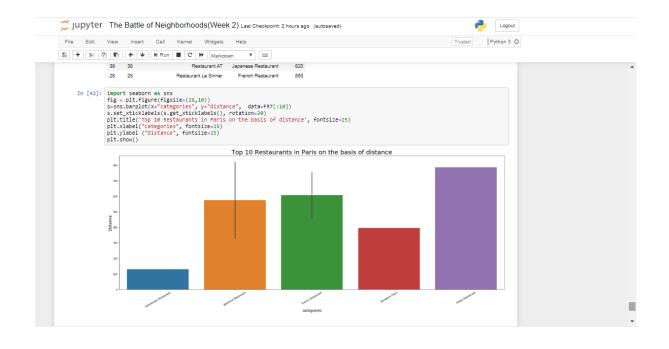

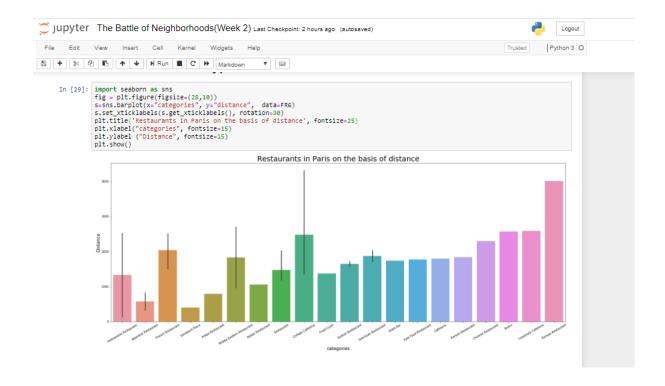

9) This information is visualized along with the top 10 restaurants in this Dataframe which gives the final result.

4) <u>RESULTS: -</u> We get an Insight of the types of Restaurants which are mostly present in Paris other than the type of French Restaurants as well like Vietnamese, Japanese, Turkish and other types. This information is beneficial as follows:- Suppose A Tourist Decides to visit Paris and is not sure about which type of food is available apart from the French type restaurants as there are many types of food all across the world. This analysis gives an insight of the types of Restaurant Options one can consider while planning to Visit Paris.

Also when we take Distance into Account, We get a more detailed view of the type of Restaurants which are ideal to be visited by a tourist in Paris. Along with the French Restaurants, The Japanese and the Vietnamese Restaurants are ideal options as well since they are near to the centre.

5) <u>DISCUSSIONS:</u> - One of the most important observations I noted while analysing the type of Restaurants and their distance is apart from the French Restaurants which are common in Paris, The restaurants of different origin like Japanese, Vietnamese were also present much nearer to

the centre which gives a tourist a variety of choices and diverse options without a lot of travelling and spending a lot of money.

Based on the Results, I want to recommend the Japanese and Vietnamese Restaurants along with the College Cafeterias apart from the French Restaurants for a better plethora of choices of food which can help a tourist to plan which restaurant to visit beforehand.

Also, I tried to integrate the Restaurants on the basis of address but I was not able to find a proper dataset of the postal addresses which would have made the project better since it would have given me an option to apply Machine Learning Algorithms like K-Means Clustering to describe the Restaurants in the form of Clusters.

6) <u>CONCLUSION</u>: -

To conclude with the Report, I would like to emphasize on the fact that this project will be a good guide to the tourists who want to explore Paris and the various food options offered by the city along with its traditional French Food. It will also give the tourists an idea of the other types of restaurants which are quite near from the centre and will help the tourists to plan the places they would like to eat without spending a lot on travelling and money.
